Acta Crystallographica Section E: Structure Reports Online is the IUCr's highly popular open-access structural journal. It provides a simple and easily accessible publication mechanism for the growing number of inorganic, metal-organic and organic crystal structure determinations. The electronic submission, validation, refereeing and publication facilities of the journal ensure very rapid and high-quality publication, whilst key indicators and validation reports provide measures of structural reliability. The average publication time is less than one month. Articles are published in a short-format style with enhanced supplementary materials. Each publication consists of a complete package – the published article, HTML and PDF supplements, CIF, structure factors, graphics, and any other submitted supplementary files.

Crystallography Journals Online is available from [journals.iucr.org](http://journals.iucr.org)

Received 15 January 2014; accepted 21 January 2014

Key indicators: single-crystal X-ray study;  $T = 150 \text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002 \text{ \AA}$ ;  $R$  factor = 0.048;  $wR$  factor = 0.138; data-to-parameter ratio = 16.5.

In the title molecule,  $C_{17}H_{13}NO_2$ , the phenyl ring is inclined to the quinoline ring system by  $43.53 (4)^\circ$ . In the crystal, molecules are linked via  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds, forming double-stranded chains propagating along [011]. These chains are linked via  $\pi-\pi$  interactions involving inversion-related quinoline rings; the shortest centroid–centroid distance is  $3.6596 (17) \text{ \AA}$ .

## 7-Methoxy-2-phenylquinoline-3-carbaldehyde

**Hasna Hayour, Abdelmalek Bouraiou, Sofiane Bouacida, Saida Benzerka and Ali Belfaitah**

### 1. Comment

Heterocyclic compounds have so far been synthesized mainly due to the wide range of biological activities. Quinoline derivatives have considerable interest since many years due to the presence of this skeleton in a large number of bioactive compounds and natural products (Montalban, 2011; Wang *et al.*, 2011). In other hand, it has been well established that presence of aryl ring at second position of quinoline moiety gives a very good antibacterial property to the target molecule and plays a significant role in development of new antibacterials (Nilsson *et al.*, 2008; Elliott *et al.*, 2006). These derivatives were found to be useful biological targets, and at present they attained much attention in the development of new drugs (Metallidis *et al.*, 2007; Kaila *et al.*, 2007). Following of our previous works related to the use of substituted 2-chloro-3-formylquinolines as precursors of different quinoline-containing heterocycles (Bouraiou *et al.*, 2011; Hayour *et al.*, 2011), we have recently reported preparations and antibacterial screening of series of compounds carrying diverse functionalities such as an amine, amide, ester group, heterocyclic unit linked to the 2-phenylquinoline entity (Benzerka *et al.*, 2011, 2012, 2013). We report herein the synthesis and single-crystal X-ray structure of 7-methoxy-2-phenylquinoline-3-carbaldehyde (I).

The molecular geometry and the atom-numbering scheme of (I) are shown in Fig. 1. The asymmetric unit of (I) consists of 2-phenylquinoline linked to 7-methoxy and 3-carbaldehyde. The substituted phenyl ring forms dihedral angle of 43.53 (4)° with heterocyclic ring of quinoline. The crystal packing can be described as alternating layers parallel to the (210) (Fig. 2). It is stabilized by C—H···O hydrogen bond (Fig. 3; Table 1), and strong  $\pi$ – $\pi$  stacking interactions between quinoline rings with a centroid-centroid distance from 3.6596 (17) Å to 4.0726 (18) Å. These interaction bonds link the molecules within the layers and also link the layers together, reinforcing the cohesion of the structure.

### 2. Experimental

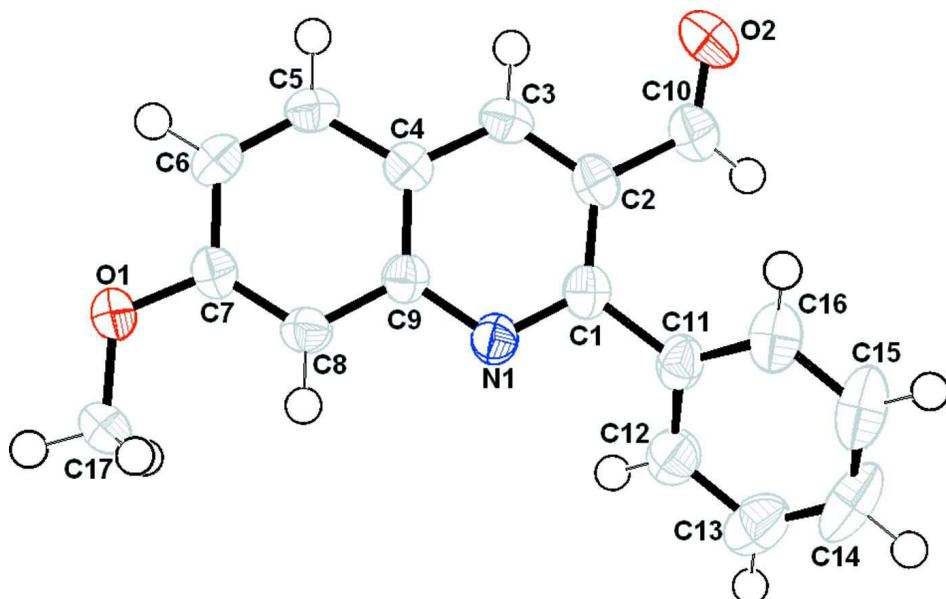

A mixture of 2-chloro-7-methoxyquinoline-3-carbaldehyde (1 mmol) and phenylboronic acid (1.2 mmol) in 4 ml DME was stirred under nitrogen. Palladium acetate (0.01 mmol), aq. K<sub>2</sub>CO<sub>3</sub> (3 mmol in 3.75 ml of H<sub>2</sub>O) and triphenyl-phosphine (0.04 mmol) were added and the mixture was refluxed for 2 h. After completion, the reaction mixture was cooled to room temperature, diluting with EtOAc and filtering through a small bed of celite. The organic layers were collected, combined, washed with water and saturated aq NaHCO<sub>3</sub> (2x10 ml), dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and concentrated under vacuum. The crude compound was purified by column chromatography on silica gel using ethyl acetate/ hexane (1/2) to afford the desired product as yellow solid. Single crystals suitable for the X-ray diffraction analysis were obtained by dissolving the pure compound in an ethyl acetate/hexane mixture and allowing the solution to slowly evaporate at room temperature.

### 3. Refinement

. Approximate positions for all the H atoms were first obtained from the difference electron density map. However, the H atoms were situated into idealized positions and the H-atoms have been refined within the riding atom approximation. The applied constraints were as follow:  $C_{\text{aryl}}-\text{H}_{\text{aryl}} = 0.95 \text{ \AA}$ ; and  $C_{\text{methyl}}-\text{H}_{\text{methyl}} = 0.98 \text{ \AA}$ ; The idealized methyl group was allowed to rotate about the C—C bond during the refinement by application of the command AFIX 137 in *SHELXL97* (Sheldrick, 2008).  $U_{\text{iso}}(\text{H}_{\text{methyl}}) = 1.5U_{\text{eq}}(\text{C}_{\text{methyl}})$  or  $U_{\text{iso}}(\text{H}_{\text{aryl}}) = 1.2 U_{\text{eq}}(\text{C}_{\text{aryl}})$ .

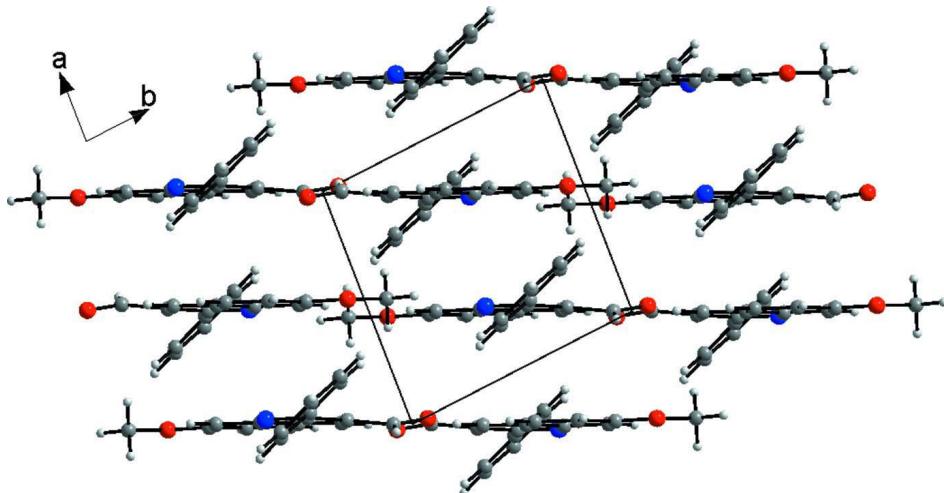

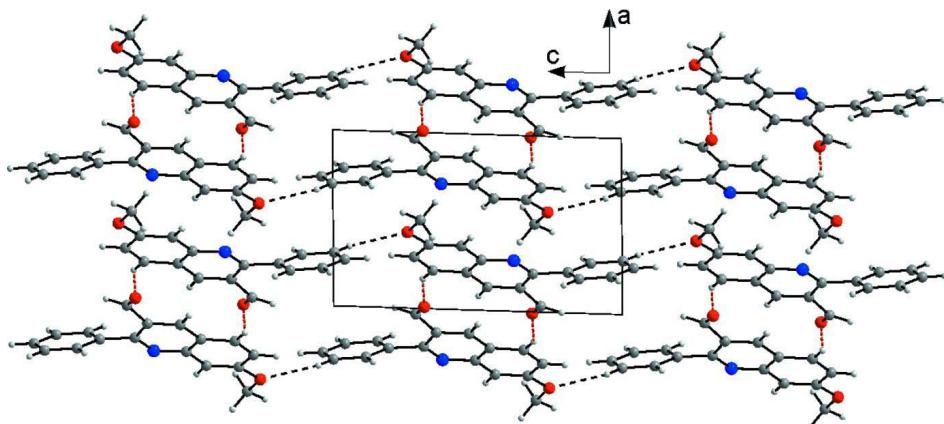

### Computing details

Data collection: *APEX2* (Bruker, 2001); cell refinement: *SAINT* (Bruker, 2001); data reduction: *SAINT* (Bruker, 2001); program(s) used to solve structure: *SIR2002* (Burla *et al.*, 2005); program(s) used to refine structure: *SHELXL97* (Sheldrick, 2008); molecular graphics: *ORTEP-3 for Windows* (Farrugia, 2012) and *DIAMOND* (Brandenburg & Berndt, 2001); software used to prepare material for publication: *WinGX* publication routines (Farrugia, 2012) and *CRYSCAL* (T. Roisnel, local program).

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
